| 28mm 500/600 | 370 | 28T2137 | 125 | 0.60 | 50 - 55 | 300 | | | | | X | | | // | 2 |

Installation Instructions:

- 1. The borehole should be drilled to full depth using a rotary percussive drill and then blown clean using compressed air.
- 2. The borehole diameter should be controlled to fall within the stated tolerance range of the Expansion Shell being used.
- 3. Screw the threadbar fully into the conical part of the Expansion Shell .
- 4. IMPORTANT: if the shell is fitted with a temporary plastic collar, it should be removed before insertion into the borehole.
- 5. Before installation, orientate the Expansion Shell as shown on the drawing below to avoid the risk of spalling.
- 6. After installation the Expansion Shell should be locked by tightening the bar to "activate" the two shells.
- 7. Alternatively, pulling the bar sharply will also activate the shells.

Testing:

- 1. To assess the safe carrying capacity of the Expansion Shell, it is recommended that pull-out tests are conducted on-site using a hollow hydraulic stressing jack to determine the depth and spacing of the boreholes.
- 2. If no initial movement is acceptable, a preload of 50kN 100kN should be applied using an hydraulic jack.

General Notes:

- 1. Expansion Shells to suit other Threadbar diameters and hole sizes are available on request.
- 2. The shells are designed to carry the ultimate capacity of the Threadbar in competent material.
- 3. Centre and edge distances are based on concrete or rock strength of 30N/mm² at 50% ultimate capacity of the bar.
- 4. Where vibration is present, the load and movement within the formties held by the shell should be constantly monitored.
- 5. This information is given in good faith and is for guidance purposes only.
- 6. Installers should satisfy themselves that use of these Expansion Shells meets the requirements of the Designer responsible.
